

Radnor Capital Partners is pleased to announce that it will be working with Velocys plc.

Velocys is a sustainable fuels company listed on the AIM market (LSE: VLS), developed from technology spin-outs of Oxford University (UK) and the Pacific Northwest National Laboratory (USA). The company's proven and proprietary technology solutions (based on the Fischer-Tropsch process) allow the production of advanced biofuels from sustainable carbon sources. Velocys is developing Europe's first commercial waste to fuels plant, with British Airways and Shell as co-investors.

"Velocys is a global leader in providing tested technology solutions for sustainable fuels production from a variety of waste materials. The technology has been demonstrated and has been chosen for third party projects, in addition to the US and UK projects led by Velocys. We are excited to work with the team as the company moves into the next phase of commercialisation.

We will be working closely with Velocys on their equity story and investor engagement to ensure the right message is being delivered to the most relevant investor audience. Radnor will act as the company's fully outsourced IR function.

We believe Velocys' model can be a game changer for aviation."

Joshua Cryer, Managing Partner
Radnor Capital Partners Ltd

"We are delighted to be working with the Radnor team on our Investor Relations efforts. As we move into the next phase of commercialisation, delivering the next generation of sustainable fuels, we believe there is an exciting story for investors.

We are uniquely well positioned to take advantage of the macro-trend of decarbonisation of fuels for aviation and heavy goods transport. The support from new and existing shareholders in July has put the Company on a firm footing, with £7m of equity raised and a further £2.8m of project funding committed from Shell and British Airways. We therefore look to the future with confidence."

Henrik Wareborn, CEO
Velocys plc
